Software Engineer with experience in AI-enabled products, networking systems, and cross-functional product delivery. Background in Software-Defined Networking (SDN), product engineering, and business automation, with a proven track record of improving delivery speed and operational efficiency.

Work Experience

Software Engineer, CyberLink

10/2024 - Present

- Owned end-to-end delivery of AI-powered creative tools and SEO-driven product features for **MyEdit** and **MyEdit Business**, serving large-scale customer-facing workflows.
- Led cross-functional execution across Product, Design, SEO, QA, and Engineering teams, consistently delivering features on schedule while balancing technical constraints and business priorities.
- Initiated and drove the development of an AI-assisted testing framework integrated into CI/CD pipelines, reducing project delivery timelines **from 6 months to 1 month**.
- Built automated business intelligence pipelines by integrating Google Analytics and multiple external data sources, reducing reporting effort by **86%** and improving data processing efficiency by **97%**.
- Played a key role in delivery planning, **effort estimation**, and **risk assessment** across multiple parallel projects, improving **execution predictability** and on-time delivery.

Software Quality Assurance Intern, MOXA

07/2023 - 09/2023

- Developed a Python-based automated testing tool for cross-platform (x86/ARM) embedded systems, reducing manual testing effort and improving hardware validation coverage.
- Performed comprehensive system-level testing across various OS environments, identifying edge cases and ensuring high system stability before release.

Research Assistant, National Center for High-Performance Computing

05/2023 - 02/2024

- Analyzed emerging network architectures (5G/6G) and MEC frameworks, evaluating their potential for high-bandwidth and low-latency applications in edge computing environments.
- Evaluated the integration of complex systems, such as LEO satellite communications, focusing on technical feasibility and network architecture optimizations.

Projects

Adaptive Routing Optimization for SDN-based SRv6 Networks

SDN | SRv6 | IPv6 | Traffic Engineering | Network Resilience

- Architected and implemented an adaptive routing framework for SRv6-based Software-Defined Networks.
- Developed a probabilistic path-selection algorithm to optimize routing decisions under dynamic network conditions.
- Improved routing resilience and service continuity through evaluation under congestion and failure scenarios.**

Skills

- | | |
|---------------------------|--|
| • Languages | C, C++, C#, TypeScript, JavaScript, Python, Go, React |
| • Networking | SDN, SRv6, IPv6, Edge Computing |
| • Infrastructure | Docker, Linux, CI/CD, Kubernetes, Virtualization (Proxmox Virtual Environment) |
| • AI-Assisted Development | Claude Code, GitHub Copilot, Gemini, Codex, Context Engineering |

Education

National Central University, Master's Degree

09/2022 - 07/2024

Information Management

3.97/4.30 GPA

- Research Focus : Software Defined Networking (SDN) , Segment Routing IPv6 (SRv6), Traffic Engineering, Network Resilience
- Scholarship: NSTC Doctoral Research Scholarship

National Taiwan Normal University, Bachelor's Degree

09/2018 - 07/2022

Technology Application and Human Resource Development

3.97/4.30 GPA
